

CLOUD AI SUMMIT • FACILITATOR GUIDE

Build systems. Not AI party tricks.

A teaching spine for guiding small law firms from “what should I automate?” to workflows, agents, digital employees, and hackathon builds they can use back at the office.

Dan Schnurbusch · Legal Tech Collective · June 25-26, 2026

Core teaching path

1. Reframe AI as staff capacity

Law firms do not need more software. They need reliable work to happen without a person reinventing it every time.

Talk track: "If you would train a human on the task, you can probably train an AI workflow on the first draft of it."

2. Find recurring work

Look for tasks with a trigger, repeatable inputs, predictable output, and clear reviewer.

- Every consultation gets reviewed.
- Every probate matter needs document chasing.
- Every lead needs the same first questions answered.

3. Separate prompt, data, tools, and judgment

A useful AI system is not one mega-prompt. It is a job description plus source material, allowed tools, constraints, and a human approval point.

4. Demo a build, not a miracle

Show the boring parts: files, prompts, failed output, revision, test data, and final artifact. Trust comes from the seams.

5. Make Monday real

Every attendee should leave with one owner, one workflow, one risk boundary, and one 30-minute block to test it.

Workshop modules

Day 1: Find work worth automating

20-30 minutes. Teach people how to identify high-value recurring work before touching a tool.

- Consultation prep
- Client update emails
- Document request checklists
- Website FAQ drafts

Day 2: Build a digital employee

60-75 minutes. Show a working agent-style workflow with role, inputs, tools, review point, and test cases.

Recommended demo: lightweight firm website or KPI dashboard from structured notes/sample data.

Hackathon: Build, present, judge

2 hours. Teams choose a narrow workflow, build a rough artifact, and present business value and risk boundaries.

Presentation format

1. Problem in one sentence
2. Who uses it
3. What it produces
4. How a human checks it
5. What happens Monday

Hackathon scoring rubric

25 pts**Business value**

Solves a real, frequent, painful problem.

20 pts**Workflow clarity**

Trigger, inputs, output, owner, and review step are obvious.

20 pts**Usability**

A normal staff member could run it without the builder nearby.

15 pts**Risk control**

Addresses confidentiality, hallucination, UPL, and permissions.

10 pts**Testing**

Includes edge cases, fake contacts, missing fields, or bad inputs.

10 pts**Monday readiness**

Credible next step for use or improvement after the summit.

Build ideas

Probate intake checklist generator

Intake notes → missing documents, next steps, client questions.

Client update email drafter

Case notes → plain-English update with next actions.

Consultation prep brief

Intake form → lawyer prep sheet and missing facts.

Medical record collection agent

Provider list/request log → records matrix, missing bills/auths, and next follow-ups.

Medical chronology writer

Medical records/bills → dated treatment timeline, record-cited injuries, gaps, and damages facts.

Demand letter writer agent

Liability summary + medical chronology + bills + firm demand-writing rules → structured demand draft and exhibit checklist.

Document organizer

File inventory → categories, missing items, request list.

Weekly KPI narrator

Metrics → owner briefing: what changed and what to do.

Pipeline phase auditor agent

Case export + phase rules → blocked matters, missing steps, weird items, and owner-specific next actions.

Fast judging questions

1. What job does this replace, support, or accelerate?
2. What information does it need?
3. What output does it produce?
4. Where can it be wrong?
5. Who reviews it?
6. What makes this safe enough to try next week?
